

HCL Desktop Management Software version 2.x on Infiniti Desktops

HCL Desktop Management Software

version 2.x on Infiniti Desktops

For complete peace of mind

How about a software application that takes away all your hassles managing a PC? To manage desktops efficiently, ensure maximum uptime and reduce the Total Cost of Ownership, HCL Desktop Management Software version 2.x is offered on HCL Infiniti desktops with Windows XP Professional and Windows 2000 Professional Operating Systems.

From keeping track of hardware details and ensuring security to enabling remote administration on a networked PC and even displaying a warning when it senses a hardware failure coming on, the HCL Desktop Management Software improves productivity, saves time, reduces support and administrative costs and provides peace of mind.

Specific features include Asset Management, Security, Managing Faults, etc.

This software consists of a Client application which is to be loaded in the client's machine and an Administrator application, which needs to be installed in the administrator's machine. This works on both LANs and WANs. In a WAN, the remote client can be managed by an administrator using a modem and phone line, if the client machine is configured as a remote access server. The WAN feature is available both in Windows 2000 Server and Advanced Server.

Health Monitoring and Pre-emptive Fault Management

The health monitoring and fault management utility monitors and warns you of imminent hardware failure by sending out alerts through a pop-up or email. Alert actions like shutdown, notification in log files can also be set.

The software monitors CPU fan speed, temperature and voltage, hard disk drive and memory. By providing an early warning system for administrators as well as end-users, this utility helps to minimize down time, reduces the cost of technical support and ensures business continuity.

Effortless Remote Management

Remote administration of desktops enables easier, efficient configuration and updation, diagnosis and troubleshooting of multiple desktops on a network.

The features include remote shut down, remote reboot, wake-on-lan and file transfers, all of which combine to form an effective remote administration package.

Impregnable Security

Protect your desktop from unauthorized users and prevent valuable data from being stolen using secure features such as Passwords for Power On and Setup, and I/O port control. The chassis intrusion detection feature displays the status of the system chassis for tighter control over your system resources.

Comprehensive Asset Management

Keep track of the various components in your PC with the comprehensive Asset Management feature. This tool records and fetches information relating to PC hardware and software—from the Motherboard, Processor, Memory, Hard Disk Drive, Network card, Multimedia Devices, and Ports to the Operating System Loaded, Installed Software, BIOS details, DMI and WMI details.

Now, you can easily track and manage network PCs from a central location. This saves an administrator's effort in identifying which network PCs need to be upgraded. At the same time, it reduces time spent on checking each client PC.
